US-09-383-667-19
; Sequence 19, Application US/09383667
; Patent No. 6624295
; GENERAL INFORMATION:
; APPLICANT: Adams, Camelia W.
; APPLICANT: Baton, Dan L.
; APPLICANT: Hass, Philip E.
; APPLICANT: Hass, Philip E.
; APPLICANT: Kirchhofer, Daniel
; APPLICANT: Suggett, Shelley
; TITLE OF INVENTION: Human Anti-Factor IX/IXa Antibodies
; FILE REFERENCE: P1661R2

US-09-698-286A-10

Sequence 10, Application US/09698286A

Patent No. 6677442

GENERAL INFORMATION:

APPLICANT: University of Kentucky Research Foundation

TITLE OF INVENTION: Human REV1 Gene and Protein As Diagnostic, Preventive, and Therap

TITLE REFERENCE: 050229-0247

CURRENT APPLICATION NUMBER: 05/162,140

PRIOR APPLICATION NUMBER: 60/162,140

PRIOR PILING DATE: 1999-10-29

NUMBER OF SEQ ID NOS: 39

SOFTWARE: Patentin version 3.1

SEQ ID NO 10

LENGTH: 85

TYPE: PRT

VEGANISM: C. elegans, A. thaliana, S. cerevisiae, S. pombe and H. sapiens
FEATURE:
NAME/KEY: MISC_FEATURE
OCTRION: (17)...(22)
OTHER INFORMATION: Gap in alignment
FEATURE:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Novel human anti-Factor IX/IXa antibodies against IX/IXa gamma-carboxyglutamic acid domains useful as anti-coagulant in thrombosis, stroke, and post myocardial infarction.

Claim 8; Fig 2; 84pp; English.

This sequence represents a complementarity determining region 1 (CDR1) of the light chain variable domain of a human anti-factor IX/IXa Gla domain antibody. Factor IXa is a vitamin K dependent plasma serime protease that participates in the blood coaqulation pathways. The Gla domain of factor IXa and its zymogen factor IX contains important structural determinants for interaction with high affinity binding sites on vascular endothelial

for different types of fat deposits can also be produced e.g. intra-abdominal fat associated with heart disease

```
AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid sequences of anti-adipocyte monoclonal antibody heavy chain, light chain, and heavy chain complementarity determining regions (CDR) of the invention. The antibodies can be used in the treatment of obesity and obesity related diseases. The antibodies can be used to deliver drugs or pro-drugs directly to the fat mass of an obese patient or the antibody can be used as a therapeutic itself. Antibodies binding specifically to adipocytes can be used to activate the immune system to destroy the cells by complement mediated lysis. The antibodies binding specifically to detectable label such as radiolabel, fluorescent or chemical group and used in methods of diagnosis in human subjects e.g. to determine the presence of adipocyte antigen on the surface of an adipocyte sample. The antibodies can be used as an alternative means of treatment for obese the antibodies can be used as an alternative means of treatment for obese patients other than undergoing surgery to remove excess fat. Antibodies

can be used as a therapeutic itself. Autibodise binding specifically to chestry to the antibodises of anti-adipocyte monoclonal antibody heavy chain, light chain, and heavy chain complementarity determining regions (CDR) of the invention. The antibodies can be used in the treatment of obesity and cobsenty related diseases. The antibodies can be used to deliver drugs or pro-drugs directly to the fat mass of an obese patient or the antibody can be used to activate the immune system to destroy the cells of complement mediated lysis. The antibodies binding specifically to detectable label such as radiolabel, fluorescent or chemical group and cectable label such as radiolabel, fluorescent or chemical group and cectable label such as radiolabel, fluorescent or detection and electron methods of diagnosis in human subjects e.g. to detect or detect or determine the presence or level of adipocytes in a cell or tissue sample. The antibodies can be used as an alternative means of treatment for obese patients other than undergoing surgery to remove excess fat. Antibodies for different types of fat deposits can also be produced e.g. intra-abdominal fat associated with heart disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Panel of specific binding members of antibody molecules which bind to whole adipocytes is used in the treatment of obesity and obesity related diseases.

Claim 1; Page 163; 182pp; English.

AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid
sequences of anti-adipocyte monoclonal antibody heavy chain, light chain,
and heavy chain complementarity determining regions (CDR) of the
invention. The antibodies can be used in the treatment of obesity and
besity related diseases. The antibodies can be used to deliver drugs or
prodrugs directly to the far mass of an obese patient or the antibody
can be used as a therapeutic itself. Antibodies binding specifically to
can be used to activate the immune system to destroy the cells
by complement mediated lysis. The antibodies binding specifically to
caplement mediated lysis. The antibodies binding specifically to
by complement mediated lysis. The antibodies binding specifically to
cativate an be used to activate the immune system to destroy the cells
by complement mediated lysis. The antibodies e.g. to determine the
presence of adipocyte antigen on the surface of an adipocyte to detect or
determine the presence or level of adipocytes in a cell or tissue sample.
The antibodies can be used as an alternative means of treatment for obese
patients other than undergoing surgery to remove excess fat. Antibodies
for different types of fat deposits can also be produced e.g. intraabdominal fat associated with heart disease

RESULT 5 AAU02627

AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid
sequences of anti-adipocyte monoclonal antibody heavy chain, light chain,
and heavy chain complementarity determining regions (CDR) of the
invention. The antibodies can be used in the treatment of obesity and
cobesity related diseases. The antibodies can be used to deliver drugs or
cobesity related diseases. The antibodies can be used to deliver drugs or
con be used as therapeutic itself. Antibodies binding specifically to
adipocytes can be used to activate the immune system to destroy the cells
by complement mediated lysis. The antibodies may be labeled with a
confidence of adipocyte artigonals in human subjects e.g. to determine the
cused in methods of diagnosis in human subjects e.g. to determine the
cused in methods or level of adipocytes in a cell or tissue sample.
The antibodies can be used as an alternative means of treatment for obese
confinence than undergoing surgery to remove excess fat. Antibodies
for different types of fat deposits can also be produced e.g. intraconfinence. Panel of specific binding members of antibody molecules which bind to whole adipocytes is used in the treatment of obesity and obesity related Gaps ö fat; 100.0%; Score 66; DB 4; Length 110; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ANU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid
sequences of anti-adipocyte monoclonal antibody heavy chain, light chain,
and heavy chain complementarity determining regions (CDR) of the
invention. The antibodies can be used in the treatment of obesity and
chesity related diseases. The antibodies can be used to deliver drugs or
pro-drugs directly to the fat mass of an obese patient or the antibody
can be used as a therapeutic itself. Antibodies binding specifically to
adipocytes can be used to activate the immune system to destroy the cells
by complement mediated lysis. The antibodies may be labeled with a
cused in methods of diagnosis in human subjects e.g. to determine the
creatible label such as radiolabel, fluorescent or chemical group and
used in methods of diagnosis in human subjects e.g. to determine the
creatible label such as radiolabel, fluorescent or chemical group and
used in methods of diagnosis in human subjects e.g. to determine the
creatible label such as radiolabel, fluorescent or thesuse sample.
The antibodies can be used as an alternative means of treatment for obese
patients other than undergoing surgery to remove excess fat. Antibodies
for different types of fat deposits can also be produced e.g. intra-
abdominal fat associated with heart disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Panel of specific binding members of antibody molecules which bind to whole adipocytes is used in the treatment of obesity and obesity related diseases.

Claim 1; Page 124; 182pp; English.

ANU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid
sequences of anti-adipocyte monoclonal antibody heavy chain, light chain,
and heavy chain complementarity determining regions (CDR) of the
invention. The antibodies can be used in the treatment of obesity and
consists related diseases. The antibodies can be used to deliver drugs or
pro-drugs directly to the fat mass of an obese patient or the antibody
can be used as a therapeutic itself. Antibodies binding specifically to
can be used to activate the immune system to destroy the cells
by complement mediated lysis. The antibodies binding specifically to
can be used to activate the immune system to destroy the cells
by complement mediated lysis. The antibodies binding apecifically to
caption of adipocyte antigen on the surface of an adipocyte to detect or
determine the presence or level of adipocytes in a cell or tissue sample.
The antibodies can be used as an alternative means of treatment for obese
patients other than undergoing surgery to remove excess fat. Antibodies
for different types of fat deposits can also be produced e.g. intraabdominal fat associated with heart disease

Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.

Claim 1; Page 2666-2667; 3148pp; English.

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antithemmatic and antiALDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and activity such as cancer, immune, and autoimmune disorders and immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of the invention

Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g.

```
This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to thromosome 1944 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scFvs) derived, preferably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The fragment thereof, of either human, murine, rat or monkey BLyS. The fragment invention refers to the use of such antibodies in various methods of present invention refers to the use of such antibodies in various methods contraint expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including mysethenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as AIDS and proliferative disorders including leukaemia, carcinoma and cortivities such as antirheumatic, antiallergic and cytostatic. This activities such as antirheumatic, antiallergic and cytostatic. This colypeptide sequence date for this patent did not form part of the printed specification, but was obtained in electronic format contractly from WIPO at ftp.wipo.int/published pott_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antibody that specifically binds neurokinin B, useful for preparing a composition for treating or preventing hypertension or preeclampsia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antibody; neurokinin B; hypotensive; gynaecological; gene therapy; hypertension; pre-eclampsis; NKB.

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the E Lymphocyte Stimulator (TMF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory.

C of thibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant bLyS expression and activity such as cancer, immune, and autoimmune disorders and cliebases.

C administered to go enemon variable immunosficiency (VID) and climunodeficiency (e.g. common variable immunosficiency (VID) and committed in the common variable immunosficiency (VID) and common variable immunosficiency (VID) and committed in the common variable immunosficiency (VID) and committed variable immunosficiency (VID) and committed variable immunosficiency (VID) and committed variable variable variable variable variable variable variable uired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent antibodies and fragments of the antibodies described in the method of acquired

lung New antibody or its fragment, useful for treating, preventing or ameliorating a cancer, e.g. colon, breast, uterine, pancreatic, lurgastrointestinal cancer, or Kaposi's sarcoma or, graft versus host disease, AIDS

Claim 2; Page 288; 301pp; English.

WHCDR1 (heavy chain variable domain complementarity determining region), WHCDR2, WHCDR3, WLCDR1 (light chain variable domain complementarity determining region), WLCDR2 or WLCDR3. The antibody or its fragment immunospecifically binds TRAIL (tumour necrosis factor; TWP-related apoptosis-inducing ligand) receptor 7 (TR7). TR7 is also referred to as TRAIL receptor 2 (TRAIL-R2), death receptor 5 (DR5) and KILLER. The antibody or its fragment is useful for treating, preventing or amtibody or its fragment is useful for treating, preventing or gastrointestinal cancer or Kaposi's sarcoma or cancer of the central nervous system such as medulloblastoma, neuroblastoma or gioblastoma or graft versus host disease, AIDS (acquired immune deficiency syndrome) or graft versus host disease, AIDS (acquired immune deficiency syndrome) or neurodegenerative disorder. The invention is useful in antibody nerapy. The present sequence is human scFv protein that specifically The invention relates to an isolated antibody or its fragments such

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 13q34 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scFvs) derived, preferably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The present invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, thase compositions are useful for identifying immune disorders uncluding mysathenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as ALDS and prodnosed including leukaemia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various activities such as antirheumatic, antiarthritic, neuroprotective, antiinflammatory, antiashmatic, antiarthritic, neuroprotective, antiinflammatory, antiashmatic, antiallergic and cycostatic. This polypeptide sequence is a single chain antibody that binds BLyS of the inventors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.
                                                                                                                                       Single chain antibody that immunospecifically binds BLyS SeqID 1927.

Sequence 43, Application US/08665202

Patent No. 5977322

GENERAL INFORMATION:

APPLICANT: Marks, James D.

APPLICANT: Schier, Robert

TITLE OF INVENTION: Tumor Antigens

TITLE OF INVENTION: Tumor Antigens

NUMBER OF SEQUENCES: 141

CORRESPONDENCE ADDRESS:

ADDRESSEE: Townsend and Townsend and Crew LLP

STREET: Two Embarcadero Center, Eighth Floor

CITY: San Francisco

STATE: California

COUNTRY: USA

ZIP: 94111-3834

COMPUTER: READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC Compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Novel human anti-Factor IX/IXa antibodies against IX/IXa gamma-carboxyglutamic acid domains useful as anti-coagulant in thrombosis, stroke, and post myocardial infarction. CCCCCX88X44X8X111X48X3X6X8X8X8X8X84X411X68X6X6CCCCX88X6

Claim 8; Fig 2; 84pp; English.

This sequence represents a complementarity determining region 2 (CDR2) of the light chain variable domain of a human anti-factor IX/IXa Gla domain antibody. Factor IXa is a vitamin K dependent plasma serine processe that participates in the blood coaqulation pathways. The Gla domain of factor IXa and its zymogen factor IX contains important structural determinants for interaction with high affinity binding sites on vascular endothelial

hybrid antibody; antibody; framework region; homology; immunogenicity. Vlambda gene locus antibody amino acid sequence #7. 03-DEC-2002; 2002WO-US038450 03-DEC-2001; 2001US-0336591P 06-MAY-2004 (first entry) 402003048321-A2 Ношо варіепв 12-JUN-2003

Producing a hybrid antibody or hybrid antibody fragment by operatively linking the selected framework sequences to one or more complementarity determining regions of the initial antibody.

(ALEX-) ALEXION PHARM INC

Wu D;

Rother R,

WPI; 2003-513753/48.

Disclosure; SEQ ID NO 98; 77pp; English.

The invention relates to a method of producing a hybrid antibody or hybrid antibody fragment by: (1) providing an initial antibody having specificity for a target; (ii) determining the sequence of a variable cregion of the initial antibody; (iii) selecting a first component of the catabase of antibody sequences contained in a reference sequence of the first component to sequences contained in a reference catabase of antibody sequences or antibody fragment sequences from a target species; (v) selecting a sequence from an antibody in the database which demonstrates a high degree of homology to the first component; (vi) selecting a second component of the variable region which is different the first component, the second component selected from the group consisting of FRI, FR2, FR3 and FR4; (vii) comparing the sequence of the second component to sequences contained in a reference database of the antibody sequences or antibody fragment sequences from the target species (viii) selecting a sequence from the database which demonstrates a high degree of homology to the second component and which is from a different antibody than the selected antibody; and (ix) operatively linking the

AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid
sequences of anti-adipocyte monoclonal antibody heavy chain, light chain,
and heavy chain complementarity determining regions (CDR) of the
condition. The antibodies can be used in the treatment of obesity and
cobesity related diseases. The antibodies can be used to deliver drugs or
pro-drugs directly to the far mass of an obese patient or the antibody
can be used as a therapeutic itself. Antibodies binding specifically to
adipocytes can be used to activate the immune system to destroy the cells
by complement mediated lysis. The antibodies may be labeled with a
cused in methods of diagnosis in human subjects e.g. to determine the
presence of adipocyte antigen on the surface of an adipocyte to detect or
ceternalment be presence or level of adipocytes in a cell or tissue sample.
The antibodies can be used as an alternative means of treatment for obese
patients other than undergoing surgery to remove excess fat. Antibodies

ö
selected framework sequences to one or more complementarity determining regions (CDRs) of the initial antibody to produce a hybrid antibody or hybrid antibody fragment. The method is useful for producing a hybrid antibody or hybrid antibody fragment (claimed). The antibody and fragments are useful for therapeutic and diagnostic purposes. The method uses entire framework regions from a single antibody variable heavy or variable light chain to receive the CDRs. This produces antibodies that are highly homologous and exhibit reduced immunogenicity while maintaining an optimum binding profile. This sequence represents the amino acid sequence of an antibody from the Vlambda gene locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Panel of specific binding members of antibody molecules which bind to whole adipocytes is used in the treatment of obesity and obesity related

Making antibodies (e.g. anti-decay accelerating factor antibody) for diagnosing or treating e.g. lung cancer comprises identifying an antigen that is differentially expressed on the surface of two or more distinct cell populations. Making

Disclosure; Fig 5A; 52pp; English.

The present sequence is that of the light chain variable region (VL) of the anti-decay accelerating factor (DAF) human antibody LU30. The VH region is given in AAY06063. LU30 has a binding affinity (Kd) for DAF of about 13 nM. It was produced using a novel method for making antibodies which can be used for cancer diagnosis or therapy. The method comprises:

live cancer cell; (b) selecting an antibody phage library to a live cancer cell; (b) selecting an antibody phage or antibody which binds selectively to the live cancer cell; and (c) identifying an antigen to which the antibody phage or antibody binds. To obtain LU30, a human acry library was used to search for tumour-associated antigens by panning the cumour bronchial epithelial cell line, BEAS-2B. The invention also describes a method for identifying an antigen which is differentially expressed on the surface of 2 or more distinct cell populations. The antice of the composition comprising the antibody, or a composition comprising the antibody, is useful for in vivo cancer diagnosis or therapy. In particular, the antibody is useful for diagnosing or treating lung cancer, e.g. small-cell lung cancer, non-small cell lung cancer, large cell lung carcinoma, lung 8X88888888888888X8

Edwards BM, Main SH, WPI; 2001-282031/29. N-PSDB; AAS03458. Panel of specific binding members of antibody molecules which bind to whole adipocytes is used in the treatment of obesity and obesity related diseases.

Claim 1; Page 128-129; 182pp; English.

AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid sequences of anti-adipocyte monoclonal antibody heavy chain, light chain, and heavy chain complementarity determining regions (CDR) of the invention. The antibodies can be used in the treatment of obselty and obserty related diseases. The antibodies can be used to deliver drugs or pro-drugs directly to the fat mass of an obese patient or the antibody can be used as a therapeutic itself. Antibodies binding specifically to adipocytes can be used to activate the immune system to destroy the cells by complement mediated lysis. The antibodies may be labeled with a detectable label such as radiolabel, fluorescent or chemical group and used in methods of diagnosis in human subjects e.g. to determine the

RESULT 7 AAU02627

```
AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid

condenses of anti-adipocyte monoclonal antibody heavy chain, light chain,

condenses of anti-adipocyte monoclonal antibody heavy chain,

condenses, the antibodies can be used in the treatment of obesity and

condenses. The antibodies can be used to deliver drugs or

condenses. The antibodies can be used to deliver drugs or

condenses. The antibodies can be used to deliver drugs or

condenses. The antibodies can be used to activate the immune system to destroy the cells

condense can be used to activate the immune system to destroy the cells

condense the methodies may be labeled with a

condense to a radiolabel, fluorescent or chemical group and

detectable label antiganosis in human subjects e.g. to determine the

condense of adipocyte antiganosis in human subjects in a cell or tissue sample.

condense can be used as an alternative means of treatment for obese

condense can be used as an alternative means of treatment for obese

condense can be used as an alternative means of treatment for obese

condense can be used as an alternative means of treatment for obese

condense can be used as an alternative means of treatment for obese

condense can be used as an alternative means of treatment for obese

condense condense condense condense can be produced e.g. intra-

condense condense condense with heart disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Panel of specific binding members of antibody molecules which bind to whole adipocytes is used in the treatment of obesity and obesity related

Osbourn JK, Allen DJ, Mccafferty JG;

WPI; 1997-319779/29. N-PSDB; AAT72133. Specific binding members for human carcinoembryonic antigen - bind to the A3-B3 extracellular domain of hCEA and are substantially non-cross-reactive with human liver cells; used for diagnosing cancer.

Claim 14; Fig 1b; 128pp; English.

This polypeptide sequence comprises the light chain variable region (VL) of human carcinoembryonic antigen (hCEA)-specific antibodies CEA1, CEA2 and CEA3. WH (AAA721213-15) and VL (AAA721313-15) gene sequences were obtained for anti-hCEA antibodies CEA1-CEA7 (see AAM19876-85). A claimed specific binding member (A) comprises an hCEA specific antibody antigen binding domain that has a dissociation constant for hCEA of less than 1 x 10 -8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-83 extracellular domain of hCEA and/or to cell-associated hCEA over hCEA over soluble hCEA. Preferred (A) include yairings of VH and VL sequences from CEA1-7, or their CDR sequences, as well as CEA6 VH and VL variants. (A) is used to detect cells expressing hCEA, in vivo or in vitro, especially tumour cells for disgnosing cancer, e.g. adenocarcinoma of the colon, lung or breast

AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid

sequences of anti-adipocyte monoclonal antibody heavy chain, light chain,

and heavy chain complementarity determining regions (CDR) of the

invention. The antibodies can be used in the treatment of obesity and

cobesity related diseases. The antibodies can be used to deliver drugs or

cobesity related diseases. The antibodies binding specifically to

can be used as a therapeutic itself. Antibodies binding specifically to

adipocytes can be used to activate the immune system to destroy the cells

complement mediated lysis. The antibodies may be labeled with a

cy complement mediated lysis. The antibodies may be labeled with a

cy used in methods of diagnosis in human subjects e.g. to determine the

cy treather label antigen on the surface of an adipocyte to detect or

cy the antibodies can be used as an alternative means of treatment for obese

cy the antibodies can be used as an alternative means of treatment for obese

cy patients other than undergoing surgery to remove excess fat. Antibodies

cy different types of fat deposits can also be produced e.g. intra-

abdominal fat associated with heart disease
                                                                                                                                                                                                                                                                                    Panel of specific binding members of antibody molecules which bind to whole adipocytes is used in the treatment of obesity and obesity related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Panel of specific binding members of antibody molecules which bind to whole adipocytes is used in the treatment of obesity and obesity related diseases.

Claim 1; Page 146; 182pp; English.

AAU02501-AAU02535, and AAU02641-AAU02748 represent the amino acid
sequences of anti-adipocyte monoclonal antibody heavy chain, light chain,
and heavy chain complementarity determining regions (CDR) of the
invention. The antibodies can be used in the treatment of obesity and
cobesity related diseases. The antibodies can be used to deliver drugs or
cobesity related diseases. The antibodies and be used to deliver drugs or
con be used as a therapeutic [test]. Antibodies binding specifically to
adipocytes can be used to activate the immune system to destroy the cells
concepted can be used to activate the immune system to destroy the cells
by complement mediated lysis. The antibodies may be labeled with a
concepted in methods of diagnosis in human subjects e.g. to determine the
consence of adipocyte antigen on the surface of an adipocyte to detect or
concepted the presence or level of adipocytes in a cell or tissue sample.
The antibodies can be used as an alternative means of treatment for obese
concepted that undergoing surgery to remove excess fat. Antibodies
concepted the presence of fat deposits can also be produced e.g. intraconcepted the presence of the deposits can also be produced e.g. intraconcepted the presence of the presence of the deposits can also be produced e.g. intraconcepted the presence of the presence of the deposits can also be produced e.g. intraconcepted the presence of the presence of the presence of the deposits can also be produced e.g. intraconcepted the presence of the presence of the presence of the deposits can also be produced e.g. intraconcepted the presence of the deposits can also be produced e.g. intraconcepted the presence of the presence

Selecting an scFv against a peptide target by expressing a target fusion protein having a DNA binding domain or activation domain of a transcription activator, useful for diagnosing, preventing and/or treating HIV infection and cancer.

Claim 123; SEQ ID NO 61; 150pp; English

The invention relates to a method of selecting a single chain antibody (scFv) against a peptide target in a yeast by expressing a library of scr fataion proteins in yeast cells, expressing a target fusion protein can the yeast cells expressing the scFv fusion proteins having either the cartivator which send comprised in the scFv fusion proteins, and a cativator which is not comprised in the scFv fusion proteins, and a cativator which is not comprised in the scFv fusion proteins, and a cativator which school comprises either an activation of a sexpressed. Each scFv fusion protein comprises either an activation comparise of an activation of a sexpressed. Each scFv fusion protein comprises either an activation of a sexpression of a variable region (WH) of antibody whose sequence varies within the library, a light chain of a variable region (WL) of antibody whose sequence varies within the library independently of the captide which links the VH and VL. The expression of the cropsorter gene is activated by a reconstituted transcriptional activator formed by binding of the scFv fusion protein to the target fusion compositions of the present invention are useful for preventing and/or treating HIV infection and cancer. This sequence corresponds to the VI region of an anti-human CXCR4 loop 6 antibody gene and used to generate the scFv antibody of the invention.

```
The invention relates to an antibody that binds to loop 6 of human chemokine receptor (CXCR4). The antibody is useful in the treatment or prevention of HIV infection (e.g. HIV type 1 and HIV type 2) and cancer of (e.g. breast, prostete, liver, renal, lung, skin, ovarian, cervical, brain, thyroid, stomach, colon, lymphoma, leukaemia and pancreas cancer cells), for screening drugs, for diagnosing disease or condition associated with interaction with chemokine receptor. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. constitute of the invention may have a use in gene therapy. The human clasmostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated to with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorders, gastrointestinal disorders, or disorders, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp concerns caused by virus, bacteria, fungi or parasite. The dithp concerns caused by virus, bacteria, fungi or parasite. The dithp concerns caused by virus, bacteria, fungi or semantic molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline concerns of gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pot/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

"Sequence 7859, Application US/09949016
Patent No. 6812339
"GENERAL INPORMATION:
TERREAL INPORMATION:
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF
FILE REFERENCE: CLOO1307
FILE REFERENCE: CLOO1307
CURRENT APPLICATION NUMBER: US/09/949,016
CURRENT FILING DATE: 2000-04-14
PRIOR APPLICATION NUMBER: 60/241,755
ADDRESSER. ADDRESSER. & MATHIS
STREET: 699 Prince Street
CITY: Alexandria
STATE: 0.0 Prince Street
CIUNTRY: USA
ZIP: 22314
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US(09/383,916
FILING DATE: 26-AUG-1999
CLASSIFICATION NUMBER: US 08/487,550
FILING DATE: 07-JUN-1995
ATTORNEY/AGENT INPORMATION:
NAME: TESKIN, ROBIN L.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             US-09-169-364A-13

Sequence 13, Application US/09369364A

Patent No. 6391610

GENERAL INFORMATION:

APPLICANT: Hurskainen, Tiina L.

APPLICANT: Hurskainen, Tiina L.

APPLICANT: Hirohat, Satoshi

TITLE OF INVENTION: Nucleic Acids Encoding Zinc Metalloproteases

TITLE OF INVENTION: 1999-08-06

CURRENT APPLICATION NUMBER: US/09/369,364A

CURRENT FILING DATE: 1999-08-06

NUMBER OF SEQ ID NOS: 31

SOFTWARE: Patentin Ver. 2.1

SEQ ID NO 13

LENGTH: 1882

TYPE: PRT

ORGANISM: Homo sapiens ADAMTS-9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
